focus on fabrics

SELECTION AND BEHAVIOR IN DRYCLEANING
National Institute of Drycleaning: National Headquarters, Silver Spring, Maryland

Western Laboratory, Glendale, California
FOREWORD

DRYCLEANING and fabrics are synonymous—drycleaners must have a thorough knowledge of fabrics, and fabric manufacturers must produce fabrics that will withstand the processes necessary to remove the soil and stains of wear.

The National Institute of Drycleaning has, for 50 years, kept its members (and the drycleaning industry) informed of the most modern, efficient, and accepted procedures for renovating soiled garments and other textile items. It has played an important part in the growth of the industry to an annual sales volume of One and three-quarter billion dollars.

We are proud of our industry’s technological advancement—we are proud of our ability to process the hundreds of different fibers and fabrics which the American textile industry develops. But we would not be realistic if we did not acknowledge the role the textile industry has played in our success—without their cooperation our progress would have been retarded. No industry in the world has made greater strides and greater improvements in its products than has the textile industry. Its scientists must produce fabrics which depend on beauty of color, texture, and design; others which must produce warmth; still others which must be cool to the wearer; some which must combine all these properties; and above all—fabrics which will give the consumer the degree of wearability and serviceability she requires.

This is no easy task. And it is no easy task for the drycleaner to renovate these fabrics and retain the characteristics they possess when new. If sometimes we fail, it is understandable, whether it is the fault of drycleaning or of the fabric itself. Our failures are few, our successes, many.

Excellent books have been written on textiles; the National Institute of Drycleaning has published several texts and hundreds of bulletins on standard procedures in drycleaning, and special processes to meet the requirements of a particular fabric or garment. But never, to our knowledge, has a book been published which combines Fabric Selection and Care with Fabric Behavior in Drycleaning, as does “Focus on Fabrics.”

Dr. Dorothy Siegert Lyle, the author, started work on “Focus on Fabrics” two years before its completion. Always a perfectionist, this
work was no exception—she checked and rechecked her data, her sources of information. The book contains 178 samples of fabrics, many of them furnished by the manufacturers, many purchased on the open market; 107 black and white, and 51 full color photographs of actual fabric damage. It is written in two parts: Part I, Selection and Care, gives description, construction, and samples of hundreds of fabrics of natural and man-made fibers: Part II, Fabric Behavior in Drycleaning, describes common and uncommon damages, their cause, and their avoidance when possible, all illustrated by photographs.

A book on textile fabrics, even when directed at one particular group—manufacturers, retailers, or drycleaners—is no easy task. But a book directed at a composite group—manufacturers, retailers, consumers, and drycleaners—is indeed a herculean task, and one which few persons are qualified to write.

Dr. Lyle has those qualifications. She received her Ph. D. degree in Home Economics at Pennsylvania State College. She came to the National Institute of Drycleaning in 1947 from Ohio State University, where she taught textiles to Home Economics students. In the 10 years she has been at NID, she has devoted her time to research on the drycleaning of fabrics. She has appeared on the programs of hundreds of drycleaner meetings, retail stores, universities and colleges. She is the author of NID's "Fashions and Fabrics" bulletins published monthly to members, keeping them informed of fabrics and their processing, and "Fabric Facts," NID's publication to Better Business Bureaus, retail stores, and those engaged in the field of textile education.

Dr. Lyle is well-known to the textile trade, the retail trade, drycleaners, and consumers. She has been an active member of the American Home Economics Association for many years, and this year was elected to the office of Recording Secretary of that organization. The Journal of Home Economics, What's New in Home Economics, and Practical Home Economics have published articles she has written on fabrics and garments. Also an active member of the American Association of Textile Chemists and Colorists, papers by Dr. Lyle have appeared in American Dyestuff Reporter, Modern Textiles, and Textile Reporter. She has lectured on textiles all over the country, not only in her position with the National Institute of Drycleaning, but also in the Distributive Education program of the U. S. Department of Education. She is the 1957-1958 Chairman of the Home Economics Research Advisory Committee, of the U. S. Department of Agriculture, Agriculture Research Service.

We offer this book with pride, and the feeling that it is a valuable addition to the textile libraries of the world. The great amount of time, effort, and money that went into its production will be compensated for if, as we hope, it produces a better understanding and knowledge of the fabrics manufactured, worn, used, and drycleaned.

January, 1958
THE FOREWORD and Introduction to the first edition of "Focus on Fabrics" have been retained in this revised edition, because they are just as pertinent today as they were five years ago.

When NID undertook to publish the original edition of "Focus on Fabrics" it was our first experience with a publication of this magnitude. The cost in time and money was tremendous and we had no idea how the book would be accepted. Several thousand copies were published, and it was estimated these would fill the demand for five years. But in less than three years the entire supply was exhausted, and hundreds of orders for copies had to be turned down. The demand for the book was just as great from colleges, universities, high schools, libraries, textile manufacturers, retailers, Better Business Bureaus, as it was from drycleaners.

When the decision was made to reprint the book it was decided to also revise it. Many new fabrics and finishes had been developed in the five years since the original printing, and many were now obsolete. The author, Dr. Dorothy Siegert Lyle, had the tremendous task of assembling all the fabrics, rechecking all the data, and bringing the book up-to-date. The revised edition contains 204 samples of fabrics, 150 black and white, and 58 full color photographs of actual fabric damage.

Dr. Lyle's qualifications and background are given in the Foreword to the original edition. Since that time, she has served as President of the American Home Economics Association (1961-1962). The Home Economics in Business Section awarded her a life membership in AHEA; and she was voted a national honorary member of Omicron Nu and Phi Upsilon Omicron, honorary Home Economics societies. In November 1963 she was elected to the Board of Directors of the American Standards Association on nomination by AHEA, and is the fourth woman to serve on that Board in 46 years. She has written articles on fabrics for leading magazines, including Seventeen and Penney's Fashions & Fabrics, and has traveled thousands of miles each year continuing her fabric lectures to colleges, retailers, drycleaners, TV and radio audiences.

We expect this revised edition of "Focus on Fabrics" to be accepted as favorably as was the original. Our pride in offering it is just as great.

January 1964
TEXTILE MANUFACTURE comprises one of America's greatest industries. The fabrics and fashions created by it play a very important role in our personal lives and in our industrial life.

Many books have been written on historic textiles, the mechanical production or engineering of textiles, the chemistry and physics involved in the producing and testing of textiles, the marketing and merchandising of textiles, the economic and psychological influence of textiles. Yet no attempt has ever been made to spell out the principles that should serve as a guide to selection in relation to behavior in use and drycleaning, or to explain why fabrics react as they do in use and drycleaning. To do this has not been an easy task since there are so many variables that influence any one principle of fabric construction, garment construction, conditions of use, and conditions of drycleaning.

A book such as this is not the work of one person, but of many people. It represents laboratory findings and the experiences of many persons over many years.

The purpose of this book is to help develop an understanding on the part of the consumer, the educator, the individuals engaged in the retailing and drycleaning trades, as to why all fabrics cannot be created to perform uniformly under all conditions of use and drycleaning; why certain fabrics react as they do in wear and in drycleaning.

The breadth and scope of our economic system of production and distribution is such that we frequently lose sight of the fact that many of the problems we experience with textiles in use and drycleaning may never be solved. We may learn to recognize them, however, so that we may better equip ourselves to understand these problems.

This book is in no way intended to be a complete treatise on fabric selection and behavior in drycleaning. In it we have attempted to bring together current information that we feel is pertinent and of general interest.

We present the material in two parts: Part I, Selection and Care, including fiber content, types of fabrics, construction, finishes and design, illustrated with swatches of fabrics; Part II, Behavior in Drycleaning, illustrated by colored and black and white photographs, answers the important questions: Why does a fabric react as it does? When does the problem arise? How may the particular problem be remedied or avoided?
WE APPRECIATE

WE EXPRESS special appreciation to those who gave their talent, time, criticism and suggestions and thus made this book possible.

For the Idea of the Book (1958 edition)
NORBERT J. BERG, former General Manager of the National Institute of Drycleaning

For the Revision of the Book
MR. GEORGE P. FULTON, General Manager

For Editorial Assistance
CECEL BONAS, Administrative Assistant
WILLIAM L. BROWNE, Director of Public Relations

For Technical Editing
GEORGE P. FULTON, General Manager
DR. JOSEPH WIEBUSCH, former Director of Research (1958 edition)
WILLIAM B. WHITE, former Director of Education and Industrial Relations (1958 edition)
ALBERT E. JOHNSON, Director of Trade Relations; also for his help in securing fabrics for the 1964 edition.

For Technical Help and Advice
ROBERT T. GRAHAM, Technical Director
W. CLAY HARDIN, Registrar
JUDSON RANDLETT, Chief Analyst of the Textile Analysis Department and his staff
JOHN A. IRELAND, former Supervisor of the General Course (1958 edition)
FRANK C. HOAK, Supervisor of Product Testing

For the Photography
A. C. LLOYD of the Research Department
VAN SIGWORTH of the Public Relations Department

For Preparation of the Draft and Manuscript
JOHNN H. SIEGERT, my brother (1958 edition)
VIRGINIA WILDER and the General Office Staff
DORIS SCHORLEMER for her help in the 1964 revision

For Reviewing the Original 1958 Manuscript
DR. JULES LABARTHE, Jr., Administrative Fellow, The Mellon Institute of Industrial Research
CHARLES W. DORN, Former Director of Research, J. C. Penney Company; Consultant
MARY C. WHITLOCK, Head, Department of Textiles and Clothing, College of Home Economics, University of Rhode Island
G. HENRY RICHERT, Specialist in Distributive Education, Department of Health, Education and Welfare, Office of Education
CHARLES A. SIEBERT, formerly of the E. I. du Pont de Nemours and Company; Consultant
DR. A. FRANK TESI, Assistant to the Technical Director, Textile Division, The Celanese Corporation of America
WE ALSO APPRECIATE

WE ALSO wish to express appreciation to those firms who so generously supplied fabrics for Part I of this book.

**XV**
PART TWO — FABRIC BEHAVIOR IN DRYCLEANING

Introduction .............................................. 391

Section I: Loss or Change of Finish
Change in Fabric Construction
Loss of Anti-Static Finish;
   Loss of Softener ..................................... 397
Loss of Crisp Hand—Markings—
   Streaks ............................................. 398
Loss of Glazed Finish .................. 399
Loss of Lacquer-type Finish ........ 400
Laminated Finish—Partial or
   Complete Separation .......................... 401
Opaque Finish—Alteration or Loss .... 402
Loss of Presensitized Finish ........ 404
Reflective Finish—
   Alteration or Loss .............................. 405
Resin Finishes ................................. 406
Objectionable Odor from
   Textile Finishes ............................... 406
Rubberized Finish ......................... 406
Loss of Solvent-Soluble Sizings ...... 408
Stiffening of Fabrics .............. 409
Stiffening of Fabrics—
   Simulated Leathers and Suedes ...... 410
Loss of Water-Soluble Sizing .......... 412

Section II: Transfer and Bleeding of Color
Transfer or Bleeding of Dye
   in Drycleaning ................................ 414
Transfer or Bleeding of Dye
   in Prespotting ................................ 416
Transfer or Bleeding of Dye
   in Pressing .................................. 417
Transfer or Bleeding of Dye
   in Spotting .................................... 418
Transfer or Bleeding of Dye
   during Wear ................................ 421
Transfer or Bleeding of Color
   during Wear ................................ 424
Transfer or Bleeding of Dye
   in Wetcleaning ................................ 425

Section III: Loss or Change of Color
Color Loss from Abrasion ............. 427
Loss of Color in Acetate Fabrics ... 429
Acid Color Change on Wool .......... 430
Color Change Caused by Alkali ...... 431
Color Change from Bonded Wool ...... 432
Loss of Color from Cold Wave
   Solution ........................................... 433
Loss of Color from the Crocking
   of Dye ........................................... 434
Color Change—Fluorescent Dyes .... 436
Color Change Due to Fume Fading
   (Atmospheric Gas Fading) ............ 437
Greying and Yellowing of Nylon
   (See page 471.) ................................ 438
Color Change—Pressing ................ 439
Color Change to Light ................... 440
Mildew ............................................. 441
Color Change to O-Fading ............ 441
Loss of Color from Perfume .......... 442
Color Change from Perspiration ...... 443
Color Change Due to Redeposition
   of Soil ........................................... 444
Loss of Color—
   Naphthal Red Dye in Spotting .......... 446
Resin-Bonded Pigments ............... 447
Color Change in Salt-Sensitive Dyes 449
Solvent-Soluble Dyes ................ 450
Color Change or Loss in Storage ... 452
Color Change from Water—
   Red Dye on Rayon ........................ 453
Color Change from Water—
   Red Dye on Wool .......................... 454

Section IV: Fabric Damage
Damage to Fabric—
   Chemical Damage
   Acid Damage (Hydrocellulose) .... 455
   Acid Damage (Hydrochloric) ......... 456
   Acid Damage (Hydrochloric)
   Bonded Wool ................................ 457
Section IV: Fabric Damage

Chemical Damage, Continued:

Acid Damage (Hydrochloric) .......................... 458
Flocked Suede; Flocked Velvet ...................... 458
Acid Damage (Sulfuric) ................................. 460
Alkali Damage ........................................... 461
Chloride Damage to Silk ................................ 462
Chlorine Retention ....................................... 463
Deodorants and Anti-Perspirants .................... 464
Dissolving of Acetate .................................... 465
Metallic Corrosion ....................................... 466
Oxidizing Agents (Oxycellulose) ..................... 469
Sunlight Damage ......................................... 470
Yellowing and Greying of Nylon ...................... 471

Damage to Fabric—

Mechanical or Physical
Breaking of Yarns ....................................... 472
Chafing .................................................... 473
Flattening, Tufting, and Matting of Pile .......... 474
Insect Damage ........................................... 476

Damage to Fabric—Heat

Burning or Fusing from Hot Embers .................. 477
Creasing in Pressing .................................... 478
Glazing and Fusing ...................................... 479
Scorch ..................................................... 480
Shine ....................................................... 481
Shrinkage of Fibers from Heat—Dacron ............ 482
Shrinkage of Fibers from Heat—Heat-Sensitive ... 483

Damage to Fabric—

Fabric Construction
Abrasion on Rib Weave .................................. 484
Bar Effect in Knits ...................................... 485
Loss of Elasticity—Stretch Fabrics Containing Rubber 486
Oil Streaks ................................................. 488
Pilling ...................................................... 489
Quilted Fabrics—Damage from Fiber Batts .......... 490
Structural Design—Bouclé Yarn ....................... 492
Structural Design—Unsupported Metallic Yarns .... 493
“V” and “W” Type Velvet ............................... 494
Woven Defects ........................................... 495
Wrinkling—Permanent .................................... 498
Yarn Slippage ............................................. 499

Damage to Fabric—

Surface Designs and Prints
Corded Design (Mechanical Damage) ................. 500
Couched Design (Chemical Damage) .................... 501
Couched Design (Mechanical Damage) ................. 502
Discharge Prints ......................................... 503
Embossed Designs ....................................... 504
Eyelet Embroidery Designs ............................. 505
Flocked Designs ......................................... 506
Lacquer Stencil Prints .................................. 508
Moiré Designs .............................................. 509

Damage to Garments—

Construction and Design
Bandings—Softening ..................................... 510
Coil-type Closure of Nylon—Heat Damage .......... 511
“Cocklebur” Type Closure of Nylon—Physical Damage 512

Metal Closure—Brown Spots and Holes ............... 513
Hem Tape .................................................. 514
Interlinings—Interfacings ............................... 515
Shoulder Pads, Non-Woven Fabric (Materials that may cause Spontaneous Ignition) ............... 516
Fusible Interfacings or Press-On Linings ............ 517
Loss of Pleat/Shrinkage ................................ 518
Seam Slippage ............................................ 520
Shoulder Pads and Padding—Damage ................. 521
Stitching Thread Failures ............................... 522
Webbings—Loss of Elasticity ................................ 523

Damage to Garments—Trim
Beads—Delustered Acetate Fabric ...................... 524
Beads—Dissolving ........................................ 525
Beads—Tarnishing ........................................ 525
Belts—Damage ............................................ 526
Buttons—Damage .......................................... 527
Elbow Patches—Damage ................................... 529
Glued on Trim—Removed in Drycleaning .............. 530
Polystyrene Tear Drops .................................. 530
Clouding or Dissolving ................................... 531
Damage to Sequins ........................................ 532

Section V: Dimensional Change

Relaxation Shrinkage .................................... 533
Relaxation Shrinkage—Hydrophobic Fibers .......... 534
Swelling Shrinkage—Hydophilic Fibers ............... 535
Felting Shrinkage ........................................ 537
Shrinkage in Pressing or Finishing ..................... 538
Progressive Shrinkage ................................... 540
Shrinkage of Bias-Cut Garments ....................... 541
Shrinkage in Fabric Combinations ...................... 544
Apparent—Not Actual Shrinkage ......................... 545
Shrinkage of Plastic Interlinings ....................... 546
Shrinkage of Stitching Thread .......................... 547
Pick and Pick Shrinkage .................................. 549
Shrinkage and Puckering Due to Yarn Characteristics ........................................ 550

Section VI: Physiological Reactions

Danger from Mothproofed Garments .................... 551
Skin Irritation ............................................ 552
Smarting of Eyes ........................................ 553

Section VII: Spot and Stain Removal

Introduction .............................................. 554
Stain Identification ...................................... 555
Classification of Stains ................................ 555
Methods of Stain Removal ................................ 557
Research on Stains and Stain Removal ................... 557
New Stains ............................................... 559
Home Removal of Stains ................................ 560
Stain Removal Chart ..................................... 562
Recommendations for Clothes Care ...................... 564

BIBLIOGRAPHY ........................................... 565
INDEX .................................................. 567
ILLUSTRATIONS

PART ONE

Figure  Number  Page
1. The loops that run lengthwise of a knit fabric are called “wales” .................................................. 185
2. The loops that run crosswise of a fabric are called “courses” .................................................. 185
3. Run-resist circular knit stitch ................................................. 185
4. Single warp tricot knit stitch ............................................. 185
5. Double warp tricot knit stitch .............................................. 185
6. The milanese stitch .......................................................... 185

Figure  Number  Page
7. Plain weave ........................................................................ 186
8. Rib weave ........................................................................... 186
9. Basket weave ....................................................................... 186
10. Twill weave ......................................................................... 187
11. Satin weave ......................................................................... 187
12. Leno weave ......................................................................... 187
13. Cross-section “V” and “W” weave velvet ....................... 188

PART TWO

SECTION I

1. NID’s Textile Analysis Laboratories .................. 391
2. NID’s Textile Advisory Committee .................. 392
3. NID’s Research Laboratories .................. 392
4. Flow of textiles from maker to consumer ........ 394
5. Loss of fabric finish ......................................................... 397
6. Light streaks in silk organza when fabric is folded, pleated, darted or tucked ...................... 398
7. Bending flexing, folding, rubbing, abrading, break-up glazed finish .................................. 399
8. Paper taffeta ..................................................................... 400
9. Simulated leather separates from knitted cotton laminated to foam .................................. 401
10. Coatings used on drapery linings removed .......... 402
11. Coatings used on drapery linings stiffen .......... 403
12. Coatings used on drapery linings wrinkle .......... 403
13. Loss of presensitized finish used to form permanent pleats and creases .................. 404
14. Loss of creases in trousers ............................................. 404
15. Reflective lining fabrics lose metallic particles ................................................................. 405
16. Rubber film partially separates from rainwear fabric causing blisters on outer surface .... 407
18. Solvent-soluble sizing on net ........................................ 408
19. Resin sizing removed from net ........................................ 408
22. Simulated leather trim ....................................................... 410
23. Simulated leather jacket front of flannel dress .... 410
24. Simulated leather jacket stiffens .................. 411
25. Simulated vinyl suedes separate and stiffen .......... 411
26. Loss of water-soluble sizing ............................................. 412
27. Removal of water-soluble sizing in net ........... 413
28. Fabrics stiffen by spraying sizing ........... 413

SECTION II

29. Solvent-soluble purple dye in print ..................... 415
30. The red dye in wool lining bled ............................... 415
31. Fluorescent dyes sensitive to prespotters ........ 416
32. Bleeding of color occurred ........................................ 417
33. Black dye bled to moisture ........................................... 418
34. Black fibers in felt skirt bled to moisture ........ 419
35. Dark interlinings sometimes dyed with fugitive dyes ................................................... 419
36. Black interlining of car coat bled to moisture .... 420
37. Spotting reagent removed dye ...................................... 420
38. Yellow dye streaks caused by dye transfer .......... 421
39. Loss of color in acetate yarns—sublimation of dye ................................................... 422
40. Stay tape is stained from acetate yarns .......... 422
41. Some dyes sublime to heat and steam ......................... 423
42. Red dye of jacket lining transferred to white blouse ................................................... 424
43. Bleeding of blue dye in wetcleaning ......................... 425
44. Bleeding of dye in black grosgrain ribbon trim .......... 426
45. Bleeding of dye in thread ................................................. 426

SECTION III

46. Loss of color from abrasion in spot removal 428
47. Loss of color from abrasion in wear .................. 428
48. Loss of color in acetate fabrics .................. 429
49. Acid color change on wool ........................................... 430
50. Color change caused by alkalis .................. 431
51. Color change from bonded wool .................. 432
52. Loss of color from cold wave solution ................. 433
53. Loss of color from crocking of dye .................. 434
54. Simple test to determine crocking of dye .................. 435
55. Fluorescent dyed fabric loses brightness ........ 436
56. Fume fading-color change ........................................... 438
57. Fume fading-complete color change ...................... 438
SECTION IV

75. Fehling's solution test ........................................ 455
76. Hydrochloric acid damage to wool fabric .................. 456
77. Fabric damage from bonding wool interlining ......... 457
78. Fabric damage from bonded wool shoulder pad ...... 457
79. Flocked suede changes color from exposure to light .... 458
80. Loss of fabric strength resulting from oxidation of adhesive on flocked fabrics .................. 459
81. Flocked suede deteriorates in storage ..................... 459
82. Acid damage from neoprene latex ......................... 459
83. Damage from sulfuric acid—wool trousers .......... 460
84. Damage from sulfuric acid—Dacron and cotton .... 460
85. Alkali damage to a wool fiber ................................ 461
86. Chloride salts weaken many types of fabrics .......... 462
87. Formaldehyde resin-treated fabric ...................... 463
88. Fabric damage caused by a deodorant .................... 464
89. Acetate fibers, yarns, and fabric dissolved .......... 465
90. Metallic yarn corrosion ...................................... 466
91. Some metallic yarns turn green ................................ 467
92. Metallic yarns affected by spot removal agents .... 467
93. Removal of lacquer coating from metallic yarns ..... 468
94. Turnbull's blue test ........................................ 468
95. Tendering of vat dyed fabrics ............................ 470
96. Sunlight tendering of curtains ............................. 470
97. Yellowing, greying of nylon ................................ 471
98. Typical fabric damage in silk and wool fabric ...... 472
99. Chafing may remove color and disturb fibers .......... 473
100. Flattening of acetate pile ................................. 474
101. Flattening of deep pile fabrics containing heat-sensitive fibers .................. 475
102. Tufting of deep pile fabrics .............................. 475
103. Moth, carpet beetle and other insect damage .......... 476
104. Fabric—typical moth damage ............................. 476
105. Hot embers from cigarette or fireplace causes fabric damage ........................................ 477
106. Repeated creasing in pressing causes splitting .... 478
107. Fusing of heat-sensitive fibers pressed with too hot an iron ........................................ 479
108. Soecharing in pressing ..................................... 480
109. Shine caused by too much heat and pressure ......... 481
110. Heat in pressing causes crumpled Dacron ............... 482
111. Shrinkage of polyethylene yarns from heat .......... 483
112. Fine filament yarns in ribbed-weave fabrics ........ 484
113. Pick-up oil from knitting needle oxidized .......... 485
114. Metallic and acetate stretch yarn loses elasticity .... 487
115. Metallic stretch fabric curled and rippled in wear .... 487
116. Rubber core yarn wrapped with cotton yarn ......... 488
117. Oil streaks and smudges on silk finish ................. 488
118. Pilling of fibers of loosely twisted yarns .......... 489
119. Stitching patterns on quilted fabrics ................. 491
120. Non-woven paper-like sheet used in quilted fabric results in damage ............... 491
121. Low tear strength of non-woven paper-like lining fabric ........................................ 491
122. A decorative boucle yarn results in fabric damage .... 492
123. Unsupported metallic yarns ............................. 493
124. "V-shaped" pile velvet ................................. 494
125. Yarn slippage due to low twist, low number of yarns ...... 499
126. Yarn slippage appears as dye stain or bleeding .... 499
127. Glass cordage causes fabric damage ................. 500
128. Fabric damage of couched design traced to sulfuric acid ........................................ 501
129. Rough edge of pressure foot bar causes damage .... 502
130. Damage caused by cutting action of embroidery needle .......................... 502
131. Damage—Discharge prints .............................. 503
132. Embossed designs removed in wear and drycleaning .... 504
133. Fabric damage from too much pressure on embossing roller .......................... 504
134. Lacquer in eyelet embroidered designs may discolor in drycleaning ............... 505
135. Lacquer on edges of lace and embroidery may discolor in drycleaning .... 505
136. Metallic particles flocked to fabric surface .......... 506
137. A typical flocked design ................................ 506
138. Flocked strips that resemble velvet ribbon .......... 507
139. Flocking cemented directly to surface of fabric to create designs ............... 507
140. Flock removed, resin binder shows outline of design ........................................ 507
141. Lacquer stencil prints ................................. 508
142. Moire designs—permanent and non-permanent .......... 509
143. Pressure of engraving roller in making moire designs causes damage ............... 509
144. Some gripper bandings become soft and sticky .... 510
145. Coil-type closure of nylon ................................ 511
146. “Cockleburr” type closure of nylon ................. 512
147. Slide fasteners may cause brown spots and holes .... 513
148. Hem tape coated with plastic material, attached to dress by heat and pressure, removed in drycleaning ............... 514
149. Spontaneous combustion of a toy ...................... 516
150. Foam rubber, rug backings, and non-woven fabrics, may smolder and burn .... 516
151. Stains from press-on linings ............................ 517
152. Pleats separate in wear or drycleaning ............ 518
153. Novelty pleats lost in wear or drycleaning .................. 518
154. Plastic-type sizing used on lining fabric to hold pinched pleats solvent-soluble .... 519
155. Hangtag showing care instructions on pinched-pleated garment ............... 519
156. Seam slippage ........................................ 520
157. Deterioration of foam padding in storage .......... 521
158. Breaking or shrinking of thread ...................... 522
