## Code Drafting, Part 2: Balanced Code Tables

| The first article in differentletters appear in text [1]. The frequen guage and with the ty |  |
| :---: | :---: |
| Anal from a va cies, arra | of a larg y of sourc d alphabe |
| A | 0.08167 |
| B | 0.01492 |
| C | 0.02782 |
| D | 0.04253 |
| E | 0.12702 |
| F | 0.02228 |
| G | 0.02015 |
| H | 0.06094 |
| I | 0.06966 |
| $J$ | 0.00153 |
| K | 0.00772 |
| L | 0.04025 |
| M | 0.02406 |
| N | 0.06749 |
| O | 0.07507 |
| P | 0.01929 |
| Q | 0.00095 |
| R | 0.05987 |
| S | 0.06327 |
| T | 0.09056 |
| U | 0.02758 |
| V | 0.00978 |
| W | 0.02360 |
| X | 0.00150 |
| Y | 0.01974 |
| Z | 0.00074 |

Arranged by decreasing frequency, the list is

| E | 0.12702 |
| :--- | :--- |
| T | 0.09056 |
| A | 0.08167 |
| O | 0.07507 |
| I | 0.06966 |
| N | 0.06749 |
| S | 0.06327 |

| H | 0.06094 |
| :--- | :--- |
| R | 0.05987 |
| D | 0.04253 |
| L | 0.04025 |
| C | 0.02782 |
| U | 0.02758 |
| M | 0.02406 |
| W | 0.02360 |
| F | 0.02228 |
| G | 0.02015 |
| Y | 0.01974 |
| P | 0.01929 |
| B | 0.01492 |
| V | 0.00978 |
| K | 0.00772 |
| J | 0.00153 |
| X | 0.00150 |
| Q | 0.00095 |
| Z | 0.00074 |

The importance of letter frequency lies in balancing shaft utilization. The three standard tables given in the first article in this series are significantly unbalanced with respect to the frequencies associated with the shaft pairs.

Here are the shaft-pair frequencies for the three standard tables:
letters shaft pair frequency
Table 1

| ABCDEFG | 1,2 | 0.33639 |
| :--- | :--- | :--- |
| HIJKLMN | 2,3 | 0.27165 |
| OPQRSTU | 3,4 | 0.33659 |
| VWXYZ | 4,1 | 0.05536 |

Table 2

| ABCDEF | 1,2 | 0.31624 |
| :--- | :--- | :--- |
| GHIJKL | 2,3 | 0.20025 |
| MNOPQR | 3,4 | 0.24673 |
| STUVWXYZ | 4,1 | 0.23677 |

Table 3

| AEIMQUY | 1,2 | 0.35068 |
| :--- | :--- | :--- |
| BFJNRVZ | 2,3 | 0.17661 |
| CGKOSW | 3,4 | 0.21763 |
| DHLPTX | 4,1 | 0.25507 |

Table 1 is so badly unbalanced that for many strings shaft pair $(4,1)$ would not be used. This does not mean a shaft might not be utilized, since shaft 4 also is in shaft pair $(3,4)$ and shaft 1 also is in shaft pair $(1,2)$. However, for the string

## SLIME MOLD

shaft 4 is not utilized.
Tables 2 and 3 also are significantly unbalanced, although less so than Table 1.

It is not difficult to design a frequencybalanced code table. Here are three that are progressively more balanced:

Table 4

| EIRUGVQ | 1,2 | 0.31501 |
| :--- | :--- | :--- |
| TNDMYKZ | 2,3 | 0.25284 |
| ASLWPJ | 3,4 | 0.22961 |
| OHCFBX | 4,1 | 0.20253 |

Table 5

| EIR | 1,2 | 0.25655 |
| :--- | :--- | :--- |
| TNDUF | 2,3 | 0.25044 |
| ASLMGPV | 3,4 | 0.25847 |
| OHCWYBKJXQZ | 4,1 | 0.23453 |

Table 6

| ETCJXQ | 1,2 | 0.24938 |
| :--- | :--- | :--- |
| AOIFZ | 2,3 | 0.24942 |
| NSHDB | 3,4 | 0.24915 |
| RLUMWGYPVK | 4,5 | 0.25204 |

Table 4 was constructed by assigning letters in order of decreasing frequency to shaft pairs in order, cyclically. Thus, E, the most frequently occurring letter, was assigned to shaft pair ( 1,2 ); T , the second most frequently occurring letter, to shaft ( 2,3 ); and so on. In this method, shaft pair $(1,2)$ has a frequency that is somewhat too high, while shaft pair $(4,1)$ has a frequency that is somewhat too low. Table 4, nonetheless, is more balanced that any of the standard tables.

Table 5 was constructed in a similar fashion, except that a letter was not added if the frequency to that point was greater than 0.25 .

Table 6 is the result of a refinement to the procedure for constructing Table 5. In building Table 6, a letter was not added to a shaft pair if it would make the frequency to that point greater than 0.25 . If this could not be done for any shaft pair, the letter was arbitrarily added to shaft pair $(4,1)$.

Note that no matter how balanced a code table is, it can be defeated by cleverly chosen strings. For example,

## JAZZ ALIVE

does not use shaft pair $(3,4)$ of Table 6 . However, because shafts 3 and 4 are in other shaft pairs, all shafts happen to be utilized in this example.
