

## Shadow-Weave Wallpaper

**Variations on a Shadow Weave**

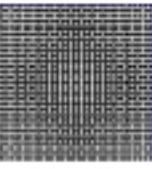

This page shows a shadow-weave and looks like a variation produced by a random permutation on the structure of the draft. A new variation is produced about every 10 seconds.

This is not intended as a serious exercise or as a method of creating weaving drafts. It's just a visual amusement that shows what is possible with an algorithmic approach to characterizing patterns in threading and shedding sequences.

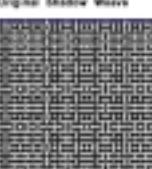

You can find a technical description [Latac \(1998, PDF\)](#).

Note: The explanation given in the document above presumes knowledge of material that has not been published in the open literature. However, if you just "read through", you may be able to get an idea of what's going on.
