Wool-weight, (-wght.) (Chem.) Bales of wool vary in weight according to the custom of the country where they are packed and whence they are exported. Thus, in the U. States, England, and the English colonies, the pound avoirdupois is the current weight; in S. America, the arroba; and in Russia, the poch. In the English trade, however, there are weights used in excess of the lb., as the score (7 lbs.), the stone (14 lbs.), the tod (58 lbs.), the ton (280 lbs.), &c.
