# **Constructing Lists...**

- There are a variety of short-hands for constructing lists.
- Lists are heterogeneous, they can contain elements of different types, including other lists.

```
> '(a b c)
(a b c)
> (list 'a 'b 'c)
(a b c)

> '(1 a "hello")
(1 a "hello")
```

### **Constructing Lists**

- The most important data structure in Scheme is the list.
- Lists are constructed using the function cons:

```
(cons first rest)
```

cons returns a list where the first element is first, followed by the elements from the list rest.

```
> (cons 'a '())
(a)
> (cons 'a (cons 'b '()))
(a b)
> (cons 'a (cons 'b (cons 'c '())))
(a b c)
```

[2]

# **Examining Lists**

- (car L) returns the first element of a list. Some implementations also define this as (first L).
- (cdr L) returns the list L, without the first element.
  Some implementations also define this as (rest L).
- Note that car and cdr do not destroy the list, just return its parts.

```
> (car '(a b c))
'a
> (cdr '(a b c))
'(b c)
```

Caria a 2000

520 Spring 2009 20

# **Examining Lists...**

Note that (cdr L) always returns a list.

```
> (car (cdr '(a b c)))
'b
> (cdr '(a b c))
'(b c)
> (cdr (cdr '(a b c)))
'(c)
> (cdr (cdr (cdr '(a b c))))
'()
> (cdr (cdr (cdr (cdr '(a b c)))))
error
```

—Spring 2008 — 38

[5]

### **Lists of Lists**

- Any S-expression is a valid list in Scheme.
- That is, lists can contain lists, which can contain lists, which...

```
> '(a (b c))
(a (b c))
> '(1 "hello" ("bye" 1/4 (apple)))
(1 "hello" ("bye" 1/4 (apple)))
> (caaddr '(1 "hello" ("bye" 1/4 (apple))))
"bye"
```

# **Examining Lists...**

A shorthand has been developed for looking deep into a list:

```
(clist of "a" and "d"r L)
```

Each "a" stands for a car, each "d" for a cdr.

● For example, (caddar L) stands for

```
(car (cdr (cdr (car L))))

> (cadr '(a b c))
'b
> (cddr '(a b c))
'(c)
> (caddr '(a b c))
'c
520—Spring 2008—38
[6]
```

# List Equivalence

- (equal? L1 L2) does a structural comparison of two lists, returning #t if they "look the same".
- (eqv? L1 L2) does a "pointer comparison", returning #t if two lists are "the same object".

```
> (eqv? '(a b c) '(a b c))
false
> (equal? '(a b c) '(a b c))
true
```

Spring 2009 29

[7]

E00 Caria - 2000

# List Equivalence...

This is sometimes referred to as deep equivalence vs.

```
> (define myList '(a b c))
> (eqv? myList myList)
true
> (eqv? '(a (b c (d))) '(a (b c (d))))
false
> (equal? '(a (b c (d))) '(a (b c (d))))
true
```

```
—Spring 2008 — 38
```

shallow equivalence.

[9]

# **List Functions** — **Examples...**

```
> (memq 'z '(x y z w))
#t
> (car (cdr (car '((a) b (c d)))))
(c d)
> (caddr '((a) b (c d)))
(c d)
> (cons 'a '())
(a)
> (cons 'd '(e))
(d e)
> (cons '(a b) '(c d))
((a b) (c d))
```

### **Predicates on Lists**

- (null? L) returns #t for an empty list.
- (list? L) returns #t if the argument is a list.

```
> (null? '())
#t
> (null? '(a b c))
#f
> (list? '(a b c))
#t
> (list? "(a b c)")
#f
```

```

# **Recursion over Lists — cdr-recursion**

- Compute the length of a list.
- This is called cdr-recursion.

```
(define (length x)
        (cond
        [(null? x) 0]
        [else (+ 1 (length (cdr x)))]
    )
)

> (length '(1 2 3))
3
> (length '(a (b c) (d e f)))
3
```

# ecursion over Lists — car-cdr-recursion

- Count the number of atoms in an S-expression.
- This is called car-cdr-recursion.

```
(define (atomcount x)
      (cond
         [(null? x) 0]
         [(list? x)
                (+ (atomcount (car x))
                   (atomcount (cdr x)))]
         [else 1]
     (atomcount '(1))
     (atomcount '("hello" a b (c 1 (d))))
—Spring 2008 — 38
                       [13]
```

- Map a list of numbers to a new list of their absolute values.
- In the previous examples we returned an atom here we're mapping a list to a new list.

```
(define (abs-list L)
         (cond
             [(null? L)'()]
             [else (cons (abs (car L))
                           (abs-list (cdr L)))]
      > (abs-list '(1 -1 2 -3 5))
      (1 \ 1 \ 2 \ 3 \ 5)
520 —Spring 2008 — 38
                           [14]
```

### **Recursion Over Two Lists**

● (atom-list-eq? L1 L2) returns #t if L1 and L2 are the same list of atoms.

```
(define (atom-list-eq? L1 L2)
  (cond
     [(and (null? L1) (null? L2)) #t]
     [(or (null? L1) (null? L2)) #f]
     [else (and
        (atom? (car L1))
        (atom? (car L2))
        (eqv? (car L1) (car L2))
        (atom-list-eq? (cdr L1) (cdr L2)))]
```

# **Recursion Over Two Lists...**

```
> (atom-list-eq? '(1 2 3) '(1 2 3))
#t
> (atom-list-eq? '(1 2 3) '(1 2 a))
#f
```

```
Append
```

# **Deep Recursion** — equal?

# Patterns of Recursion — cdr-recursion

# Patterns of Recursion — car-cdr-recursion

- We process the elements of the list one at a time.
- Nested lists are not descended into.

```
(define (fun L)
   (cond
       [(null? L) return-value]
       [else ...(car L) ...(fun (cdr L)) ...]
   )
)
```

We descend into nested lists, processing every atom.

# **Patterns of Recursion — Maps**

**Example: Binary Trees** 

```
Here we map one list to another.
```

■ A binary tree can be represented as nested lists:

```
(4 (2 () () ( 6 ( 5 () ()) ())))
```

Each node is represented by a triple

```
(data left-subtree right-subtree)
```

Empty subtrees are represented by ().

```
—Spring 2008 — 38
```

[21]

520 —Spring 2008 — 38

[22]

# **Example: Binary Trees...**

# **Example: Binary Trees...**

# **Binary Trees using Structures**

We can use structures to define tree nodes.

```
(define-struct node (data left right))
(define (tree-member x T)
  (cond
      [(null? T) #f]
      [(= x (node-data T)) #t]
      [(< x (node-data T))
            (tree-member x (node-left T))]
      [else
            (tree-member x (node-right T))]
    )
)</pre>
```

—Spring 2008 — 38

[25]

### **Homework**

- ▶ Write a function swapFirstTwo which swaps the first two elements of a list. Example:  $(1\ 2\ 3\ 4)$   $\Rightarrow$   $(2\ 1\ 3\ 4)$ .
- Write a function swapTwoInLists which, given a list of lists, forms a new list of all elements in all lists, with first two of each swapped. Example: ((1 2 3) (4) (5 6)) ⇒ (2 1 3 4 6 5).
